

"Miramax Movie Production Database" Project

Tunahan İbiş

February 8, 2025

Project Description

This database is for a movie production company. It's purpose is to store the data of producers, actors, directors, movies and theaters. Thus, a production assistant may look up to the database and see all the necessary information in one place.

Constraints

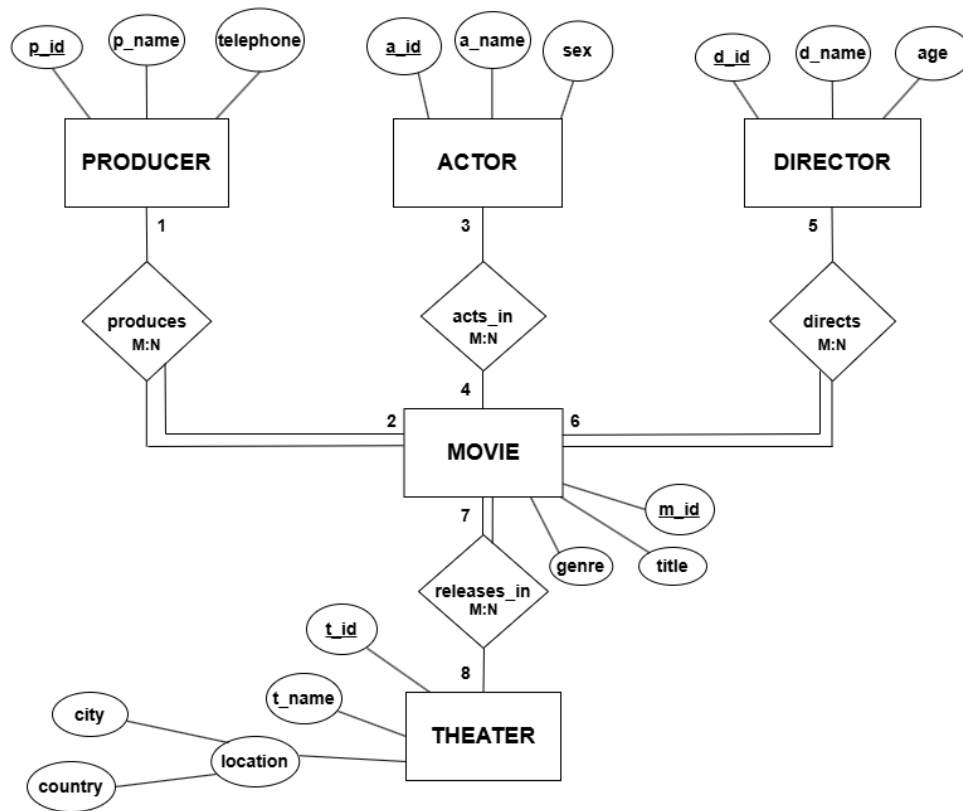

Cardinality Constraints:

- **“produces”**: M:N (There can be multiple producers for each movie, and each producer can produce multiple movies.)
- **“acts_in”**: M:N (There can be multiple actors in each movie, and each actor can act in multiple movies.)
- **“directs”**: M:N (There can be multiple directors for each movie, and each director can direct multiple movies.)
- **“releases_in”**: M:N (Each movie can be released in multiple theaters, and each theater can screen multiple movies.)

Participation Constraints:

- **Relationship 1: Partial** (There might be producers that are not currently producing any movies.)
- **Relationship 2: Total** (Every movie needs a producer to get made.)
- **Relationship 3: Partial** (There might be actors that are not currently acting in any movies.)
- **Relationship 4: Partial** (Some experimental or documentary-style films might not contain actors.)
- **Relationship 5: Partial** (There might be directors that are not currently directing any movies.)
- **Relationship 6: Total** (Every movie needs a director to get made.)
- **Relationship 7: Total** (Every movie is released in theatres.)
- **Relationship 8: Partial** (There might be theatres in restoration or renovation that do not make screenings.)

ER Diagram

ER Schema

PRODUCER = (p_id, p_name, telephone)

ACTOR = (a_id, a_name, sex)

DIRECTOR = (d_id, d_name, age)

MOVIE = (m_id, title, genre)

THEATER = (t_id, t_name, location(city, country))

produces = (p_id, m_id)

acts_in = (a_id, m_id)

directs = (d_id, m_id)

releases_in = (m_id, t_id)

Relational Schema

THEATER = (t_id, t_name, city, country)

.

. (Rest is the same with ER Schema)
